- (b) Wet-bulb temperature should be 39 °C Max. ( $T_a > 40$  °C).
- (c) No condensation.

Note (2) The maximum operating temperature is based on the test condition that the surface temperature of display area is less than or equal to 70 °C with LCD module alone in a temperature controlled chamber. Thermal management should be considered in your product design to prevent the surface temperature of display area from being over 70 °C. The range of operating temperature may degrade in case of improper thermal management in your product design.

Note (3) 11 ms, half sine wave, 1 time for  $\pm X$ ,  $\pm Y$ , and  $\pm Z$ .

Note (4) 10 ~ 200 Hz, 10 min, 1 time each X, Y, Z.

Note (5) At testing Vibration and Shock, the fixture in holding the module has to be hard and rigid enough so that the module would not be twisted or bent by the fixture. The module would not be twisted or bent by the fixture.

Note (1) Lamp current is measured by utilizing high frequency current meters as shown below:

Note (2) The lamp starting voltage V<sub>S</sub> should be applied to the lamp for more than 1 second after startup.

Otherwise the lamp may not be turned on.

Note (3) The lamp frequency may produce interference with horizontal synchronous frequency of the display input signals, and it may result in line flow on the display. In order to avoid interference, the lamp frequency should be detached from the horizontal synchronous frequency and its harmonics as far as possible.

Note (4) The life time of a lamp is defined as when the brightness is larger than 50% of its original value and the effective discharge length is longer than 80% of its original length (Effective discharge length is defined as an area that has equal to or more than 70% brightness compared to the brightness at the center point of lamp.) as the time in which it continues to operate under the condition at Ta = 25 ±2°C and I<sub>L</sub> = 5.5 ~ 6.5mA rms.

Note (5) The power supply capacity should be higher than the total inverter power consumption P<sub>BL</sub>. Since the pulse width modulation (PWM) mode was applied for backlight dimming, the driving current changed as PWM duty on and off. The transient response of power supply should be considered for the changing loading when inverter dimming.

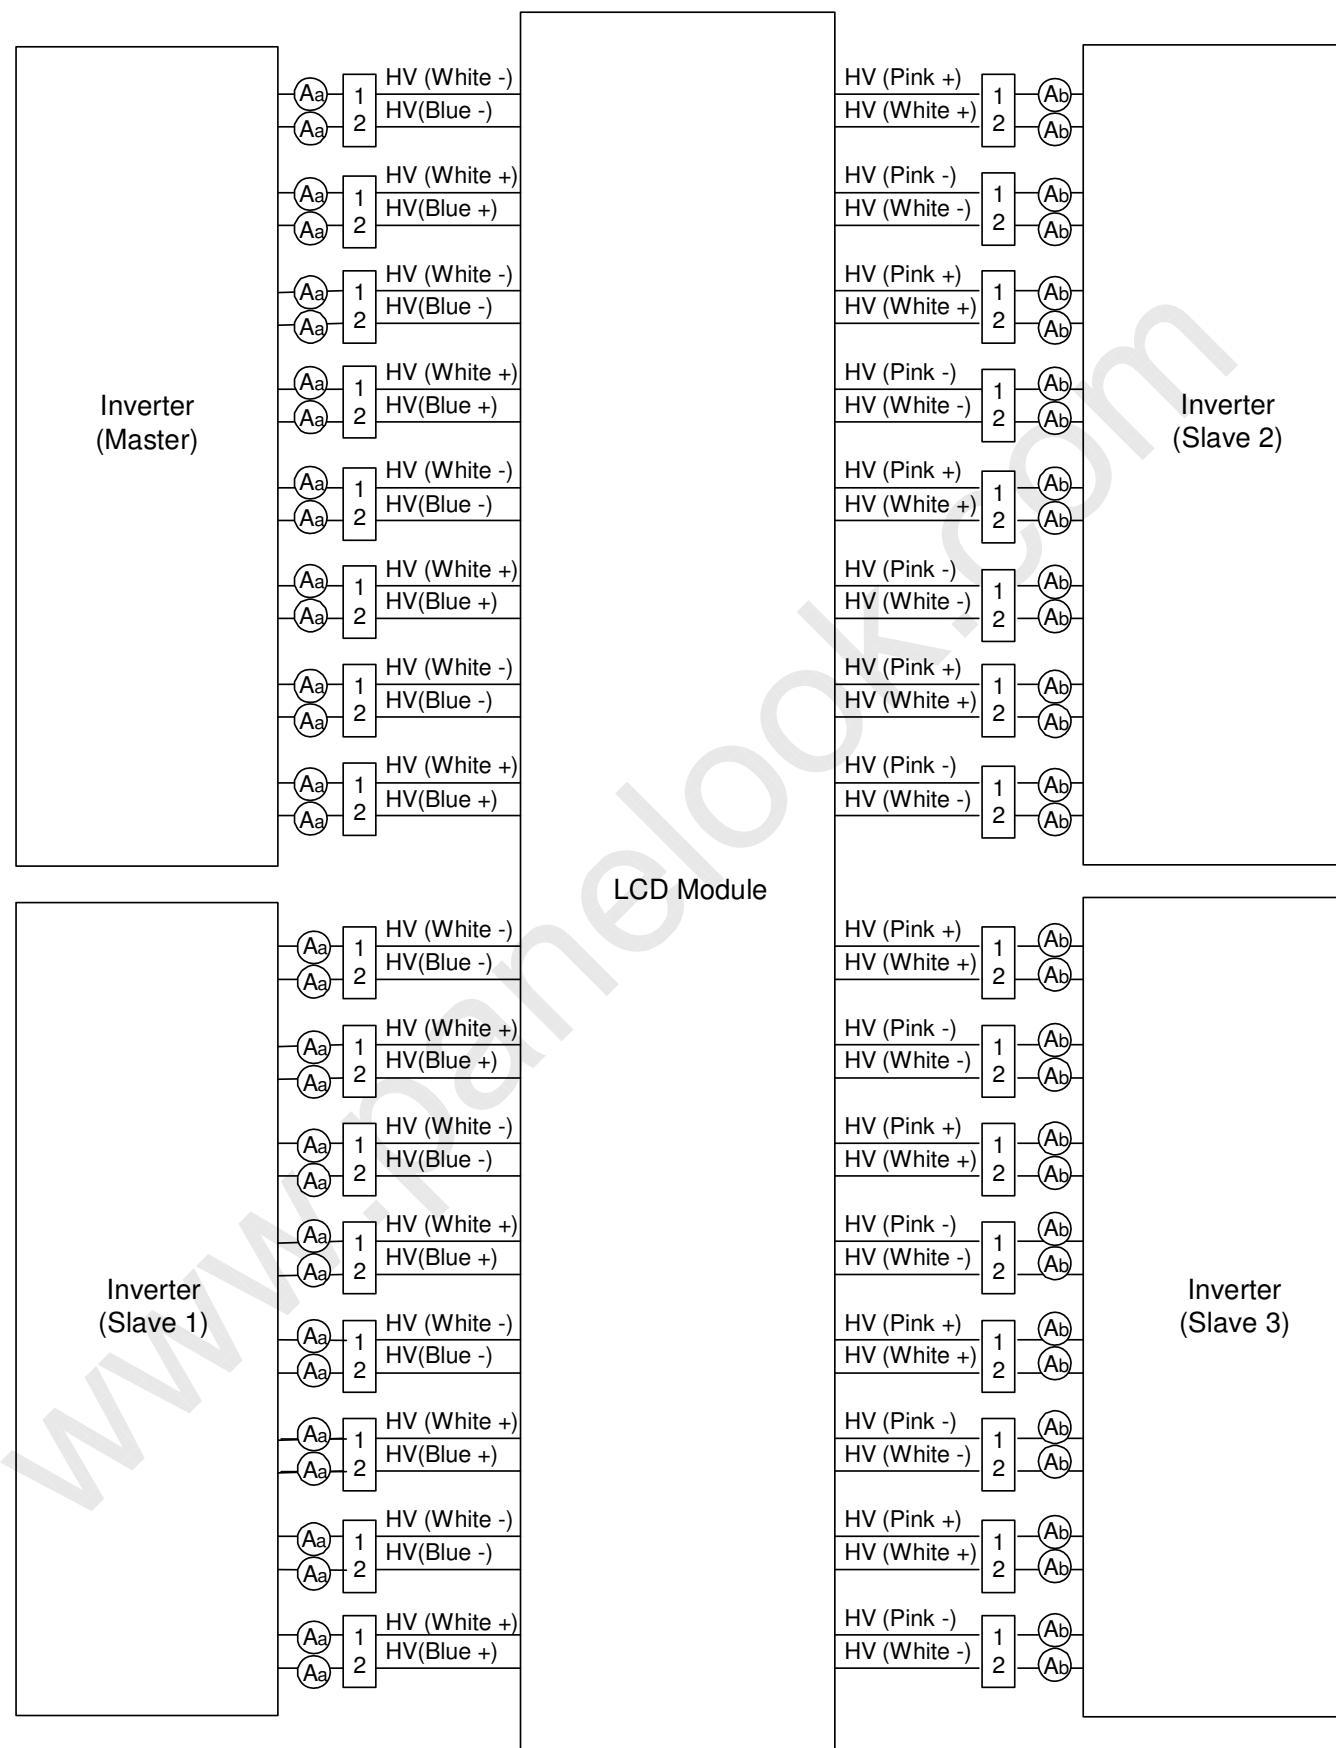

Note (6) The measurement condition of Max. value is based on 56" backlight unit under input voltage 24V, average lamp current 6.3 mA and lighting 30 minutes later.

Note (1) The SEL signal should be valid before backlight turns on by BLON signal. It is inhibited to change the internal/external PWM selection (SEL) during backlight turn on period.

Note (2) The power sequence and control signal timing are shown in the following figure.

Note (3) The power sequence and control signal timing must follow the figure below. For a certain reason, the inverter has a possibility to be damaged with wrong power sequence and control signal timing.

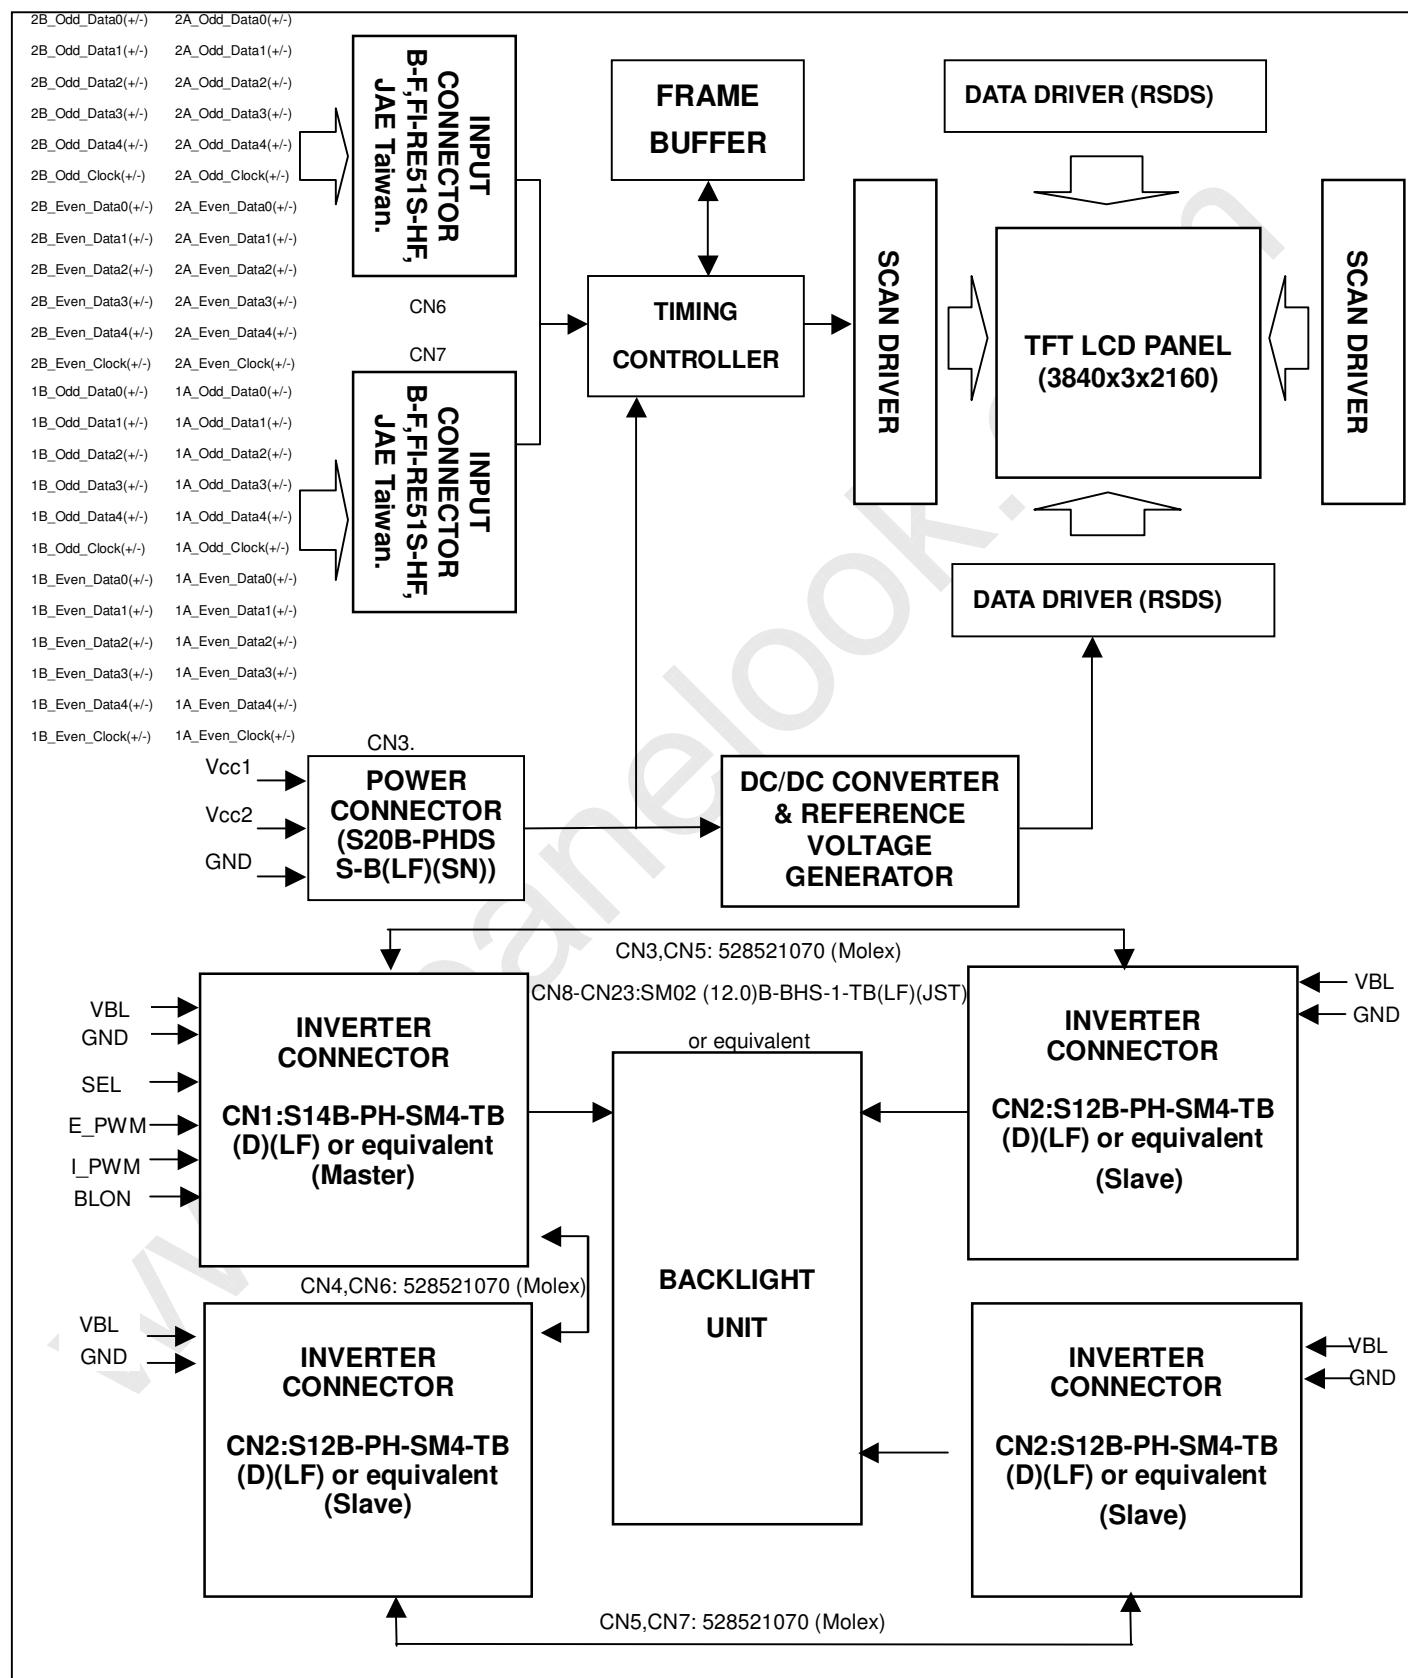

Note (4) Abnormal operation may occur if these maximum values of control signal are exceeded.

Note (5) The range of V<sub>IPWM</sub> for dimming brightness should be constrained from 0V to 2.85V (i.e., 2.85V is the start dimming point) except the Max. value of V<sub>IPWM</sub> mentioned here is only for the maximum brightness useful. In other words, 2.85V~3.15V is not suggested for using to prevent from possibly abnormal phenomenon.

## 6.5 BLOCK DIAGRAM OF IMAGE SIGNAL

The video picture (3840x2160) should be divided into four parts: the left up side (1920x1080), the left down side (1920x1080), the right up side(1920x1080) and the right down side(1920x1080). Signals of these four parts should be delivered into the module individually through each 2-channel LVDS interface. But it must be "synchronous" mutually between signals from these four 2-channel LVDS interfaces. And the protocol is specified in the LVDS interface specification.

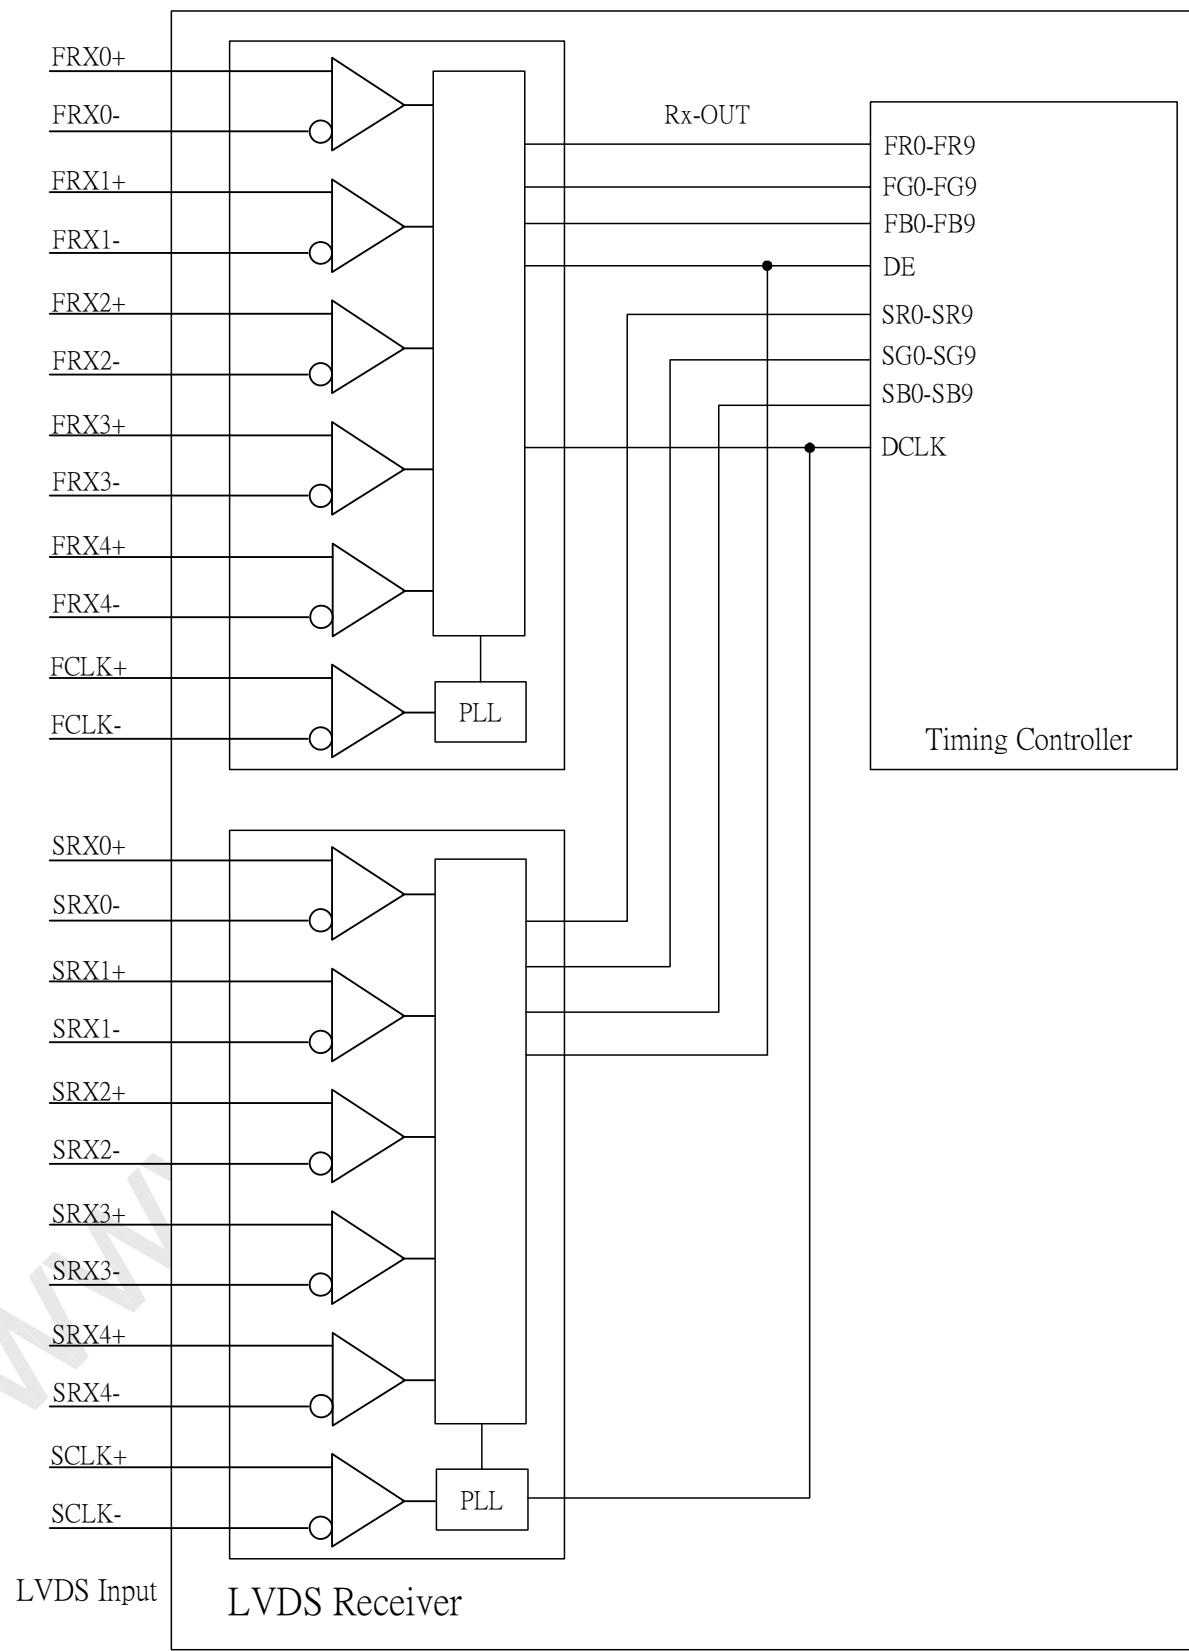

Note: (1) It must be "synchronous" mutually between signals from CN6(2A/2B) and CN7(1A/1B).  
 (2) It exists 1/3 frame buffer (i.e. buffer =1/3 x 1920 x1080 pixels) between CN6(2A/2B) and CN7(1A/1B)

Note: (1) It must be "synchronous" mutually between signals from CN6(2A) and CN6(2B).  
 (2) It must be "synchronous" mutually between signals from CN7(2A) and CN7(2B).  
 (3) It exists 1/3 frame buffer (i.e. buffer =1/3 x 1920 x1080 pixels) between CN6 and CN7.

## 6.8 COLOR DATA INPUT ASSIGNMENT

The brightness of each primary color (red, green and blue) is based on the 10-bit gray scale data input for the color. The higher the binary input the brighter the color. The table below provides the assignment of color versus data input.

Note: (1) Since this module is operated in DE only mode, Hsync and Vsync input signals should be set to low logic level. Otherwise, this module would operate abnormally.

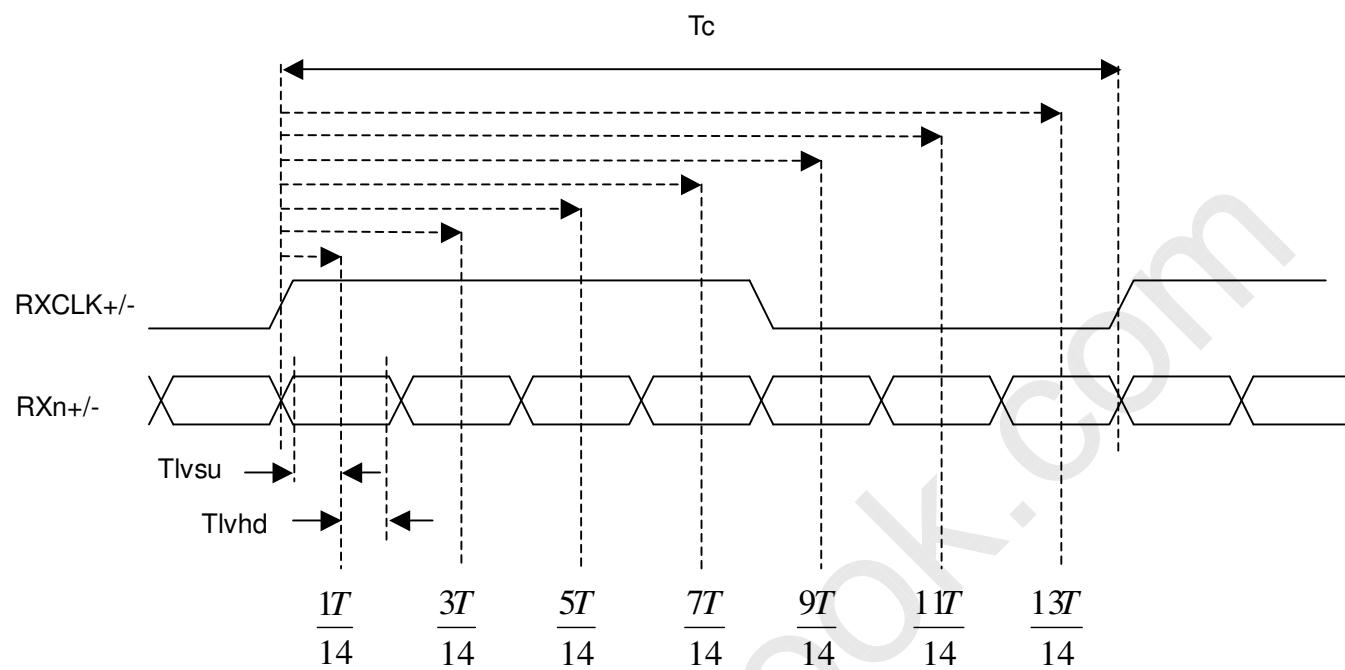

(2) (ODSEL) = (H). Please refer to Section 6.2 for detail information.

(3) (ODSEL) = (L). Please refer to Section 6.2 for detail information.

(4) The value of Typ. is based on 50Hz operation.

## 7.2 POWER ON/OFF SEQUENCE

To prevent a latch-up or DC operation of LCD module, the power on/off sequence should be followed as the diagram below.

Note : (1) The supplied voltage of the external system for the module input should follow the definition of Vcc1,2.

(2) Apply the lamp voltage within the LCD operation range. When the backlight turns on before the LCD operation or the LCD turns off before the backlight turns off, the display may momentarily become abnormal screen.

(3) In case of Vcc1,2 is in off level, please keep the level of input signals on the low and avoid floating.

(4) T4 should be measured after the module being fully discharged between power off and on period.

(5) Interface signal shall not be kept at high impedance when the power is on.

Note (1) Definition of Viewing Angle ( $\theta_x, \theta_y$ ):

Viewing angles are measured by Eldim EZ-Contrast 160R

Note (2) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression.

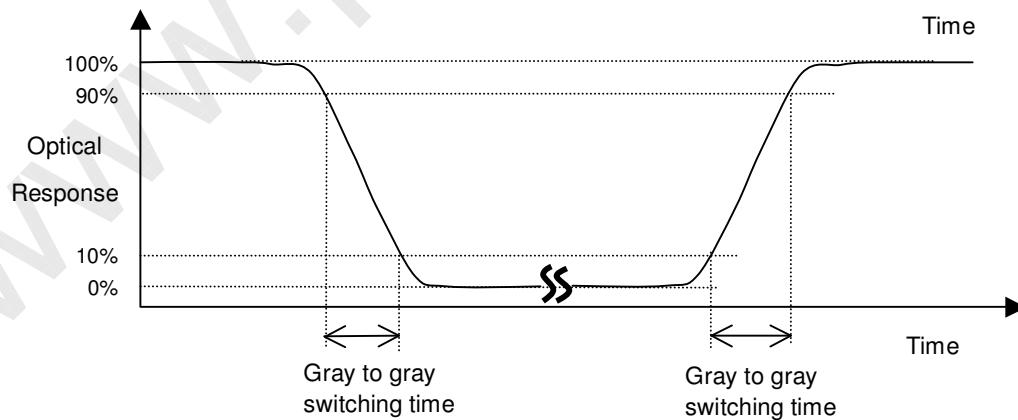

$$\text{Contrast Ratio (CR)} = L_{255} / L_0$$

$L_{255}$ : Luminance of gray level 255

$L_0$ : Luminance of gray level 0

$CR = CR (7)$ , where  $CR (X)$  is corresponding to the Contrast Ratio of the point X at the figure in Note (7).

Note (3) Definition of Gray to Gray Switching Time:

The driving signal means the signal of gray level 0, 63, 127, 191, 255.

Gray to gray average time means the average switching time of gray level 0, 63, 127, 191, 255 to each other.

Note (4) Definition of Luminance of White ( $L_C$ ,  $L_{AVE}$ ):

Measure the luminance of gray level 255 at center point and 5 points

$$L_C = L(7)$$

$$L_{AVE} = [L(4) + L(5) + L(7) + L(9) + L(10)] / 5$$

Where  $L(x)$  is corresponding to the luminance of the point X at the figure in Note (7).

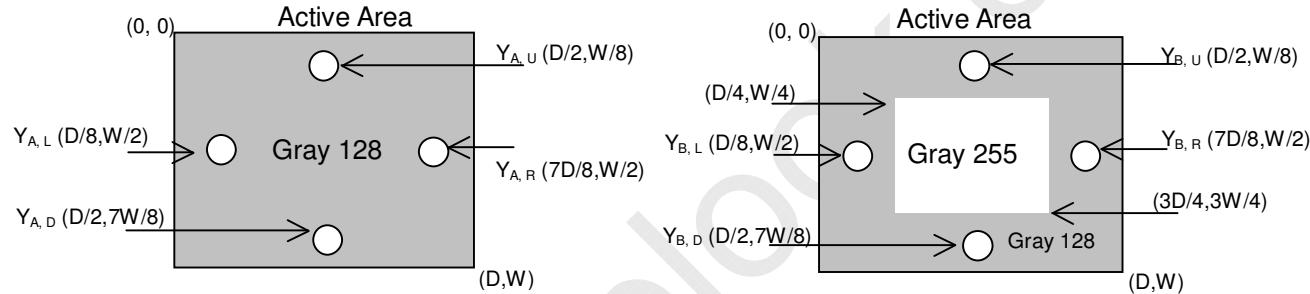

Note (5) Definition of Cross Talk (CT):

$$CT = |Y_B - Y_A| / Y_A \times 100 (\%)$$

Where:

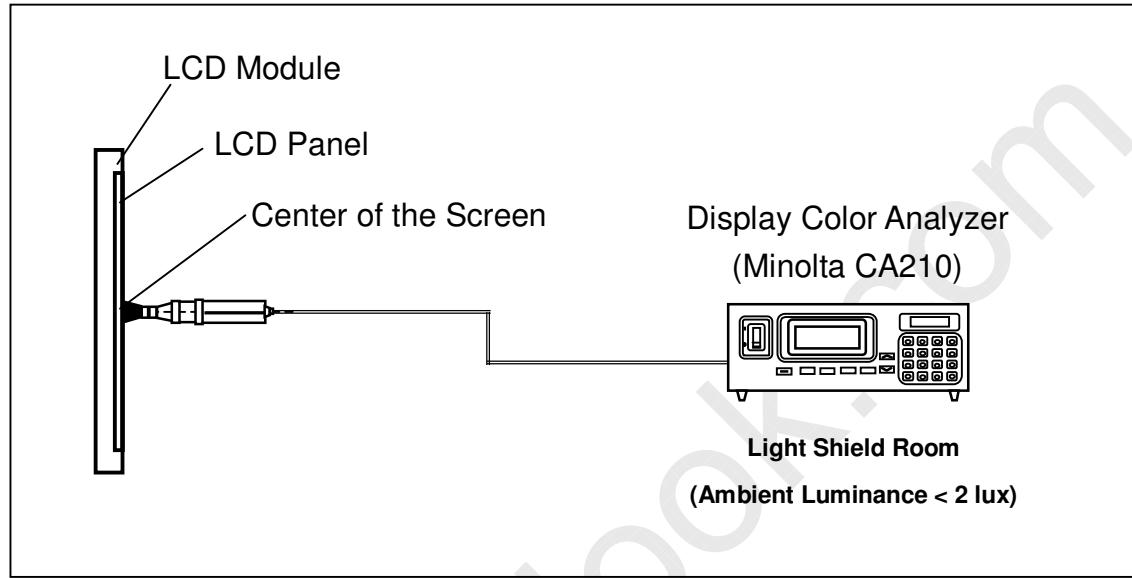

$Y_A$  = Luminance of measured location without gray level 255 pattern ( $cd/m^2$ )

$Y_B$  = Luminance of measured location with gray level 255 pattern ( $cd/m^2$ )

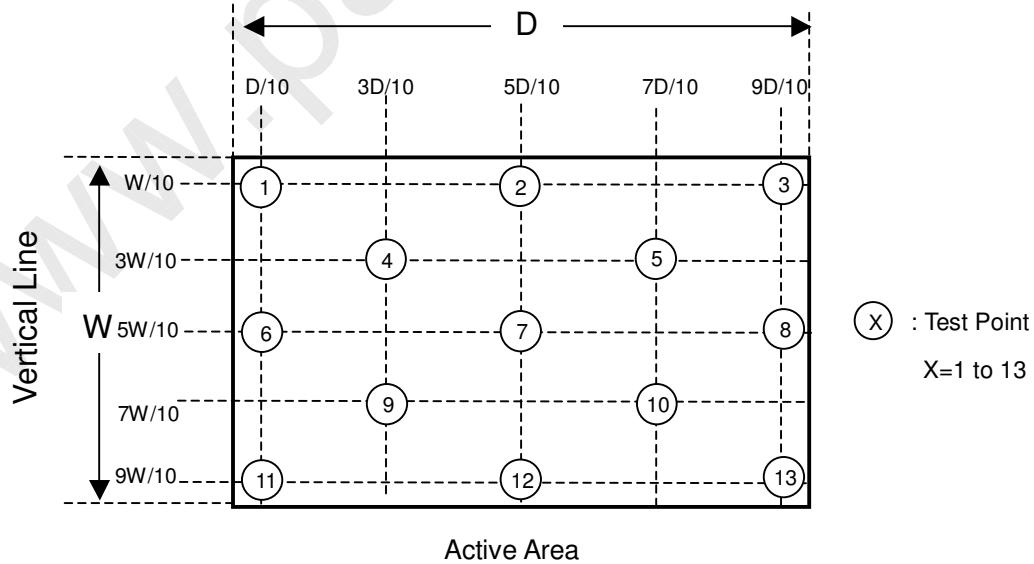

**Note (6) Measurement Setup:**

The LCD module should be stabilized at given temperature for 1 hour to avoid abrupt temperature change during measuring. In order to stabilize the luminance, the measurement should be executed after lighting backlight for 1 hour in a windless room.

**Note (7) Definition of White Variation ( $\delta W$ ):**

Measure the luminance of gray level 128 at 13 points

$$\delta W = \text{Maximum} [L(1), L(2), L(3), L(4), \dots, L(13)] / \text{Minimum} [L(1), L(2), L(3), L(4), \dots, L(13)]$$

## 9. PRECAUTIONS

### 9.1 ASSEMBLY AND HANDLING PRECAUTIONS

- (1) Do not apply rough force such as bending or twisting to the module during assembly.
- (2) It is recommended to assemble or to install a module into the user's system in clean working areas. The dust and oil may cause electrical short or worsen the polarizer.
- (3) Do not apply pressure or impulse to the module to prevent the damage of LCD panel and Backlight.
- (4) Always follow the correct power-on sequence when the LCD module is turned on. This can prevent the damage and latch-up of the CMOS LSI chips.
- (5) Do not plug in or pull out the I/F connector while the module is in operation.
- (6) Do not disassemble the module.
- (7) Use a soft dry cloth without chemicals for cleaning, because the surface of polarizer is very soft and easily scratched.
- (8) Moisture can easily penetrate into LCD module and may cause the damage during operation.
- (9) When storing modules as spares for a long time, the following precaution is necessary.
  - a. Do not leave the module in high temperature, and high humidity for a long time. It is highly recommended to store the module with temperature from 0 to 35°C at normal humidity without condensation.
  - b. The module shall be stored in dark place. Do not store the TFT-LCD module in direct sunlight or fluorescent light.
- (10) When ambient temperature is lower than 10°C, the display quality might be reduced. For example, the response time will become slow, and the starting voltage of CCFL will be higher than that of room temperature.

### 9.2 SAFETY PRECAUTIONS

- (1) The startup voltage of a Backlight is approximately 1000 Volts. It may cause an electrical shock while assembling with the inverter. Do not disassemble the module or insert anything into the Backlight unit.
- (2) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contact with hands, skin or clothes, it has to be washed away thoroughly with soap.
- (3) After the module's end of life, it is not harmful in case of normal operation and storage.

### 9.3 SAFETY STANDARDS

The LCD module should be certified with safety regulations as follows:

- (1) UL60950-1 or updated standard.
- (2) IEC60950-1 or updated standard.
- (3) UL60065 or updated standard.
- (4) IEC60065 or updated standard.
